

The cumulative Tunisian elite network holds together through the state, and its core is one integrated cadre

Giant component of every layer projected into one graph: 200,991 nodes — 130,333 individuals and 70,658 organisations — joined by 258,931 ties, 1957–2026. Of the 70,658 organisations only 369 are state bodies (0.5%), but they are 54 of the 63 organisations in the innermost core.

Source: Journal Officiel de la République Tunisienne 1957–2026 (jort.tn) joined to the Registre National des Entreprises on the matricule fiscal and RC number, plus a 13,630-name elite roster. Author's extraction; `make project`, tier `all\_sources`.

Panel (d) excludes 3 nodes in the $k \geq 7$ core that are extraction artefacts rather than entities: the rubric heading "Associations, partis, syndicats et syndics", the clause word "Objectifs", and one unlabelled node.

Caveat: at this tier a person–organisation tie is a CO-MENTION — both named in one filing — not a dated appointment, so the component is an outer bound on who is connected to whom. Panel (e) is why the person side of the core should not be read as a list of brokers: individuals outside the elite roster are mention clusters, so one node can be several men who share a name.
