

Strip the state to its decision-makers and the core of the Tunisian elite network is family business, not the bureaucracy

Same projection as fig10, with one change: a tie to a state body counts only where the stated rank is minister or above, cabinet chief, governor, head of a public body, or board level of a state-owned entity. The private sector is untouched. The giant component falls 200,991→ 156,584 nodes, and the k≥6 core holds 0 state bodies.

(d) The decision-level core is one interlocked block: 78 individuals and 98 organisations, 732 ties, 30 surnames — the seven largest carrying 48 of the people. No state body survives in it. (11 further nodes, the Bouchamaoui group, form a separate island and are not drawn.)

- individual (label = family, ×n members)
- private firm
- state body

Source: Journal Officiel de la République Tunisienne 1957–2026 (jort.tn) joined to the Registre National des Entreprises, plus a 13,630-name elite roster. Author’s extraction; `make project`, tier `all\_sources`, state floor `decision`.
Floor kept: administrateur, administrateur_delegue, ceo, chairman, chef_de_cabinet, chef_du_gouvernement, dg, gouverneur, minister, pdg, premier_responsable, president, president_ca, president_public_body, secretary_of_state.
Floor dropped: chef_de_service, sous_directeur, secretaire_general, director, director_general, dga, conseiller, representant, member, and every state tie with no stated role. A tie whose rank is UNSTATED is dropped too — it cannot be shown to clear the floor — so these are a LOWER BOUND on decision-level ties, not a census. Secretaries of state and governors are counted as decision-makers; a ministry’s directeur général and secrétaire général are not.
Panel (d) also excludes organisation nodes whose label is three characters or fewer: removing the genuine ministry hubs promotes 390 such nodes (“S” at 536 ties, “M” at 431) to the top of the degree distribution, and they are OCR damage, not firms.
