

Forest Plot: Presidential Shock Discontinuities in Female Appointments

Sharp RDD Discontinuity ($\hat{\tau}$) in female appointment share at historical cutoff (pp $\pm$ 95% CI)

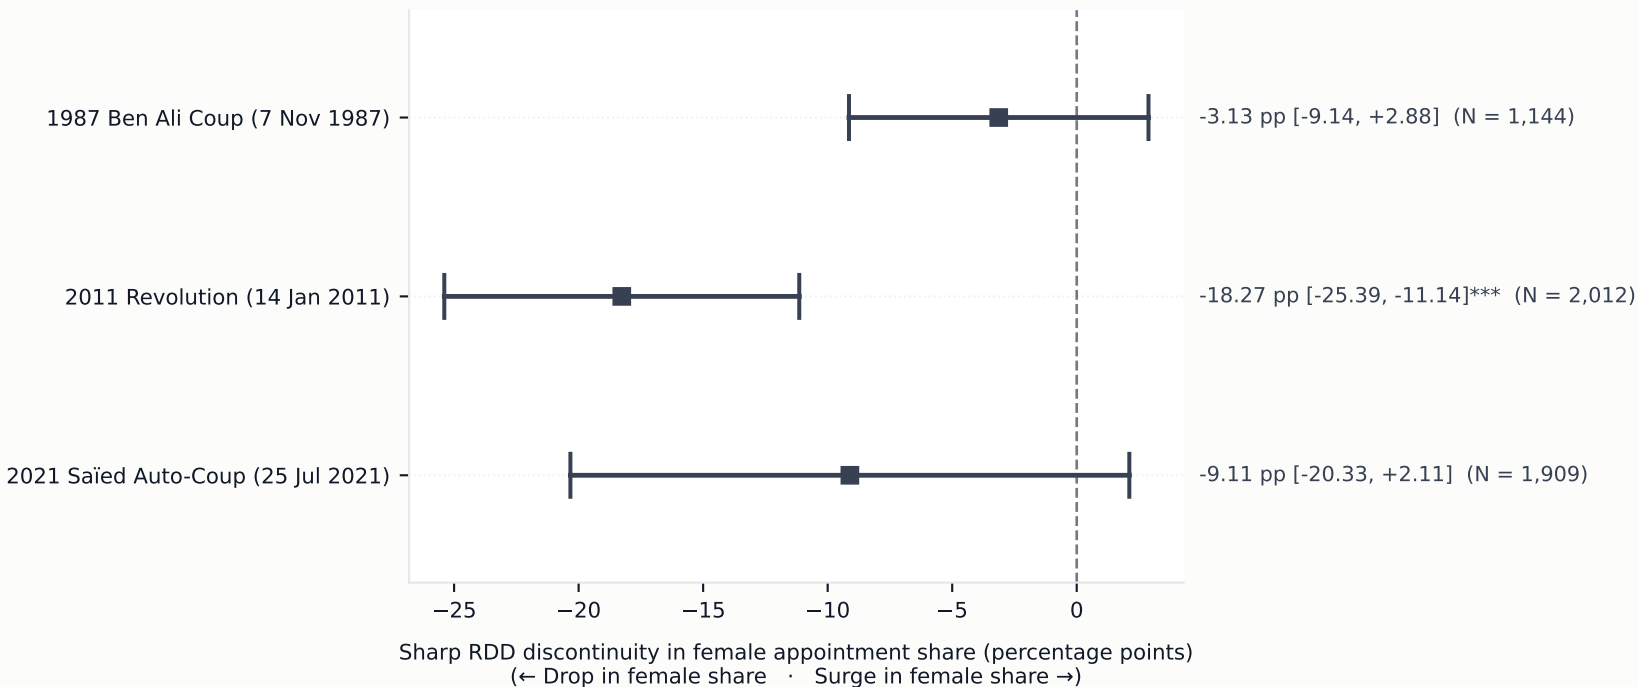

Figure 14e: Forest plot of sharp RDD discontinuities in female appointment share across presidential regime ruptures.

Notes: Local linear regression discontinuity estimates ($p = 1$, $h = \pm 180$ days, uniform kernel, HC1 robust 95% CIs) measuring the immediate shift in the share of female appointments at each historical cutoff $c = 0$. The dashed line at 0 pp denotes no change in gender composition; positive values reflect an immediate surge in female appointments. Total N across 3 windows = 5,065 acts.
