

After 2021 the demotions fell hardest on the prime minister's office and the interior

For those holding office on the eve of each rupture who took a further post within three years, how much more often their next post ranked below the last than it did for the same ministry in ordinary times. Bars are 95% intervals. The dashed line is the shift for the state as a whole, so a point to its right marks a ministry demoted harder than the rest of the administration and not merely along with it.

Source: Journal Officiel de la République Tunisienne, 1957–2026 (6,378 French issues, jort.tn). Author's extraction. A person is placed by the portfolio of the highest-ranked post they held before the rupture; merged ministries count toward each domain they merge. Ministries with fewer than 40 movers at a rupture, or 60 across the five placebo cohorts, are not plotted for it. Cells are small and the intervals are wide: at $n = 60$ a difference must exceed roughly 12 points to clear zero. With fourteen to twenty-one ministries tested per rupture, roughly one apparent result per rupture is expected by chance, so the two that clear zero in 1987 and in 2011 should be read as no more than that. The seven in 2021, all in the same direction, are not that kind of result.
