

Where the two security ministries send people, ministry by ministry

Every consecutive move made from a post in the interior or defence ministry, across the whole record, 1957–2026, with the destination named to its ministry wherever the record allows. Of 2,333 moves out of the interior, 38% stay in the ministry or go to a governorate; of 360 out of defence, 31% stay in defence. What leaves goes nowhere in particular. Set the interior's outflow against each ministry's share of all posts in the state and no ministry is out by more than 5 points (Other ministries, -5); the mean miss is 2.6. The people the interior loses disperse across the administration in about the proportions the administration already has. The one conspicuous exception each ministry makes is to the other.

Source: Journal Officiel de la République Tunisienne, 1957–2026 (6,378 French issues, jort.tn). Author's extraction. Destination is named from the post's portfolio where it has one and from the body's own name where it does not — roughly half the directorates in the table carry no portfolio, and a portfolio-only rule leaves 28% of these destinations unplaced against 8% here. Where a portfolio names several merged ministries, the lead one stands for it: a person takes one post, and counting the move into every merged domain would make the flows sum to more than the people. Eight ministries are drawn individually, being those above sixty moves; the other twenty are pooled. Destinations that are not ministries are kept apart rather than swept into the pool. Governorates are a destination but not an origin: they belong to the interior in the apparatus sense, but this figure treats the two ministries as employers and a governor is not an official of the central administration. A move is one post to the next by start date, a person holding several posts placed at the highest. The proportionality in the subtitle compares the interior's outflow to each ministry's share of every post in the record on the same naming, which is a stock against a flow and so a rough benchmark rather than a test: it answers whether the outflow is tilted towards any ministry, not whether a given tilt is larger than chance. The largest tilts are towards the prime minister's office, social affairs and higher education, and away from education.
