

Women entered Tunisian boards. They did not enter the brokerage.

Directors of BVMT-listed companies, 2005–2026. Gender is read from the honorific the filer printed (M./Mme), never guessed from the given name; the 27–70% of directors carrying no honorific are counted as unknown, never as men.

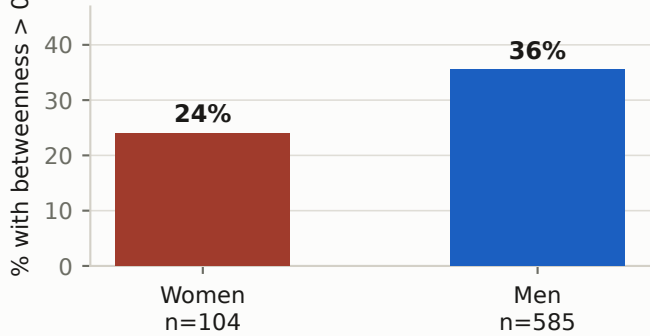

A. Women's share of directors rose — this part is well measured

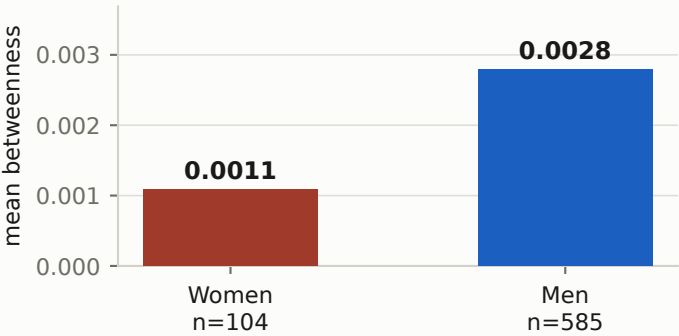

B. But almost no women hold the second seat that brokerage requires

C. Share who broker between firms at all

D. Mean betweenness, pooled 2005–2026

Betweenness is computed on the bipartite director–firm graph, where it is non-zero only for a director sitting on more than one board. Panel B is why no yearly centrality series is drawn: the women's bar is 0–6 people and zero in 8 of 22 years. Source: CMF filings, 1,887 documents. Code: `scripts/figures_women_centrality.py`
