

After 2021 officials stayed in post longer than in ordinary times

Of those holding an office on the eve of each rupture, the share still holding it over the following three years, against the average of five cohorts from the same era. The grey band spans those five. Reading the gap rather than the level is what makes the three panels comparable: exits are recorded differently from decade to decade, and both curves in a panel share whatever regime applied to them.

Source: Journal Officiel de la République Tunisienne, 1957-2026 (6,378 French issues, jort.tn). Author's extraction. Placebo cohorts are those in post on the same calendar day 3, 4, 5, 6 and 7 years before each rupture. Spells with no recorded exit are treated as continuing, so every curve overstates persistence; the bias applies equally to both curves in a panel.
