

What changed as the field assembled

Each panel against the null that makes it comparable across periods: size and density move by an order of magnitude between 1775 and today, and both closure and concentration move with them for no substantive reason. Dashed series stop at 1975, the last generation whose marriages have happened. Two readings to resist. In “how closed”, only the dashed line — against a rewiring that keeps every family's number of allies — is evidence of families marrying in circles; it is above 1 in 1875–1900 and nowhere else. In “how concentrated”, the cumulative line partly counts elapsed time, because a house present from 1775 has had two centuries to collect allies and one arriving in 1950 has had one generation.

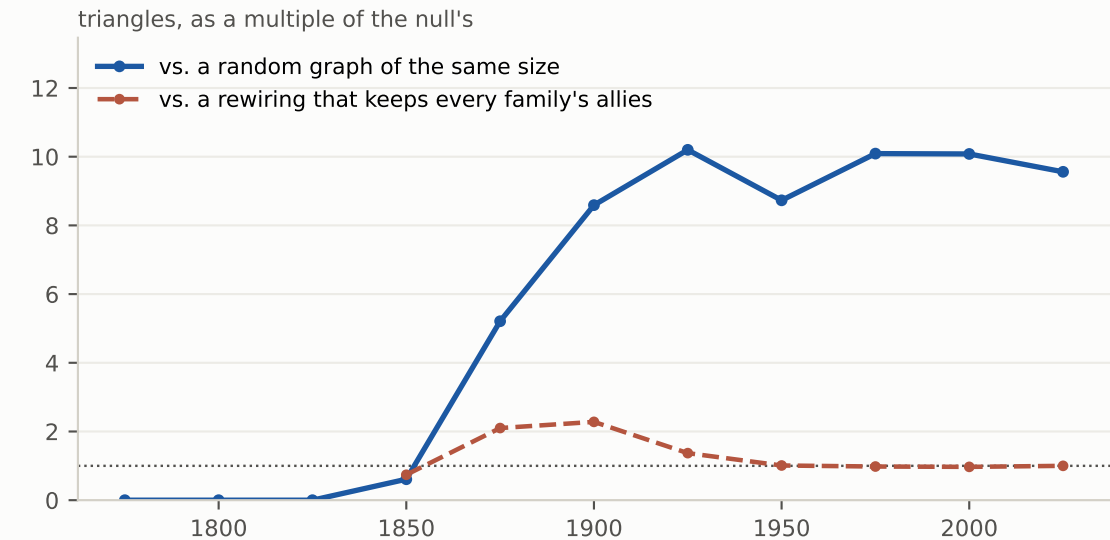

How big

How connected

How closed
